

Rosacea: How to Recovery Skin after Inflammation

Romashkina Anastasia

Beauterra clinic, Russia

Introduction & Objectives: Rosacea during the reconvalescenceneed a participation of both a dermatologist and a cosmetologist with the aim of normalization of microcirculation, moisturizing the skin, reducing inflammation and vascular severity. For this purpose laser, injections and peels are used. Each method has its advantages and disadvantages.

The Aim of The Study: determine the effectiveness of the laser, IPL, peels, injections of hyaluronic and succinic acids and develop protocols for the correction of patients with rosacea.

Materials and Methods: The correction of rosacea was performed out in 20 female and male patients aged 25-40 years old in the stage of reconvalescence. We used a preparation containing high molecular hyaluronic acid (11 mg/ml) and succinic acid (16 mg/ml), Light Pod Neo, peels. The course included from 3 procedures (1 every 2 weeks). Results were evaluated using International Global Aesthetic Improvement

Scale (GAIS), the questioning of patients before and after the procedures and in vivo confocal laser scanning microscopy data obtained on the first and the last day of the course and 30 days after the end of the course.

Results: Two weeks after beginning of the course, skin improvement was observed in all patients a positive dynamic in to varying degrees: a decrease in redness and vascular severity was observed in patients who received laser and IPL treatment, peels - reducing redness and severity of inflammation, injections - reducing redness, skin reactivity and improving skin quality. Allergic reactions have not been recorded. Absence of effect and negative dynamics during therapy were not revealed.

Conclusion: developed protocols for the correction of patients with rosacea, taking into account the clinical picture of the disease.
