

## New Modalities in Nursing Education Inter-Collaborative Education

**Maryann Godshall**  
Drexel University, USA

New methods of delivering nursing education are needed in today's complex healthcare environment. Traditional methods of teaching facts, student memorization, and testing to determine learning are not adequately preparing nursing students for the practice environment. A major obstacle new graduate nurse's face is communicating, working with, and collaborating with other disciplines. One method to bridge this gap is developing inter-collaborative experiences for medical residents, nurses, and other disciplines while in school. An inter-collaborative simulation experience delivering "bad news" and discussing palliative care options to live standardized or simulated patients (SP's) will be discussed. Conclusions found were that all participants felt this experience enhances their ability to interact with patients, families, and work with other disciplines collaboratively. This experience created life-long experience and skills new nursing professionals can utilize in the practice environment.

### Biography:

Dr. Maryann Godshall, PhD, RN, CNE, CCRN, CPN is an Assistant Clinical Professor at Drexel University College of Nursing and Health Professions. She obtained her BSN from Allentown College of St. Francis DeSales and her MSN from DeSales University. She has a post-master's degree in Nursing Education from Duquesne University, Pittsburgh, PA.
